Descriptions

LX7302INR is designed for Gigabit Ethernet 20km transmission transceivers, according to Small Form Factor Pluggable Multi-Sourcing Agreement (MSA) SFF 8074i-2001, are high performance and cost effective transceivers. They are compatible with IEEE Std 802.3-2008 1000BASE-BX20-U.

LX7302INR transceivers integrate a built-in WDM coupler which can separate 1550nm input light and 1310nm output light.

LX7302INR are compliant with RoHS.

Pin Description

Table 2. Pin Description

Pin	Name	Function/Description	Notes
1	Rx GND	Receiver ground	-
2	Rx VCC	Receiver power supply	4
3	SD	LVTTTL Signal detection output, internally pull up. Asserts high when input optical power level is above threshold	2

4	RD-	Receiver data output-, AC coupled internally	3
5	RD+	Receiver data output+, AC coupled internally	3
6	Tx VCC	Transmitter power supply	4
7	Tx GND	Transmitter ground	-
8	Tx DIS	Transmitter Disable. Laser output disabled on high or open	1
9	TD+	LVPECL Data input+ ,AC coupled internally	5
10	TD-	LVPECL Data input- ,AC coupled internally	5
F	MS	Mounting Studs, chassis grounded or N/C	6

Notes:

- Tx DIS input is used to shut down the laser output per the state table below. It is pulled up within the module with a 4.7KΩ-10KΩ resistor.

Low (0 – 0.8V):	Transmitter on
Between (0.8V and 2V):	Undefined
High (2.0 – VccT):	Transmitter Disabled
Open :	Transmitter Disabled
- SD (signal detected) is an open collector/drain output which should be pulled up Internally with a 4.7KΩ-10KΩ resistor to supply $V_{ccT}+0.3V$ or $V_{ccR}+0.3V$. When low, this output indicates the received optical power is below the worst case receiver sensitivity (as defined by the standard in use). High indicates normal operation. In the low state, the output will be pulled to <math><0.8V</math>.
- RD-/+ : These are the differential receiver outputs. They are AC coupled 100Ω differential lines which should be terminated with 100Ω differential at the user SERDES. The AC coupling is done inside the module and thus not required on the host board.
- VccR and VccT are the receiver and transmitter power supplies. They are defined as 3.3V±5% at the SFF connector pin. The in-rush current will typically be no more than 30mA above steady state supply current after 500ns.
- TD-/+ : These are the differential transmitter inputs. They are AC coupled differential lines with 100Ω differential termination inside the module. The AC coupling is done inside the module and is thus not required on host board.
- The mounting Studs are provided for module mechanical attachment to host board. They may also provide an optional connection of the module to the equipment chassis ground to improve EMI/EMC performance.

Absolute Maximum Ratings

Stresses in excess of the absolute maximum ratings can cause permanent damage to the device. These are absolute stress ratings only. Functional operation of the device is not implied at these or any other conditions in excess of those given in the operational sections of the data sheet. Exposure to absolute maximum ratings for extended periods can adversely affect device reliability.

Required Host Board Components

The MSA power supply noise rejection filter is required on the host PCB to meet data sheet performance. The MSA filter incorporates an inductor which should be rated 400mA DC and 1Ω serial resistance or better. It should not be replaced with a ferrite. Figure 1 shows the recommended host board power supply circuit.
